Modernizing the Northeast Grid Strategies Efforts and Regional Issues

Modern Grid Initiative

June 27, 2006

**Bruce Germano
Vice President
Retail Services**

The Need for New Technology: A Case for Intelligent Grid Technology

- The National Electric Grid is Vital to the Success of the Economy
- Economic Perspective
 - \$100 to \$160 Billion per year due to outages
 - \$24 billion per year due to PQ
 - Need to improve to help U.S. business compete
- Utility Investment Perspective
 - Demands from our customers Re: SQRA are rapidly increasing
 - Cost pressures, market restructuring and new technology are rapidly causing changes in the way we do business
 - Significant costs / investment recovery requirements necessitate strategic planning and technology deployment

The Importance of Manufacturing / High Technology to Long Island

- Employment / Cost of Living
 - Average 4% unemployment but 15,000 jobs added primarily service sector
 - Average wage of \$43K only 10% higher than National Average
 - Average cost of housing \$450K, with Property taxes averaging \$10K
- Manufacturing
 - Today less than 10% of total 1.24 million jobs
 - Stabilizing
 - Creates new high value added jobs and can stimulate new technology and new industries
- Manufacturing / Technology Opportunities
 - Defense
 - Homeland Security
 - Medical Manufacturing
- Long Island's Economy is Robust; if compared to a state it would be about 15th of 50 states in size. Yet we must think of the future, and the role we play in the economy.

Question: Is Long Island any different than any other of the US?

Improving Manufacturing Competitiveness

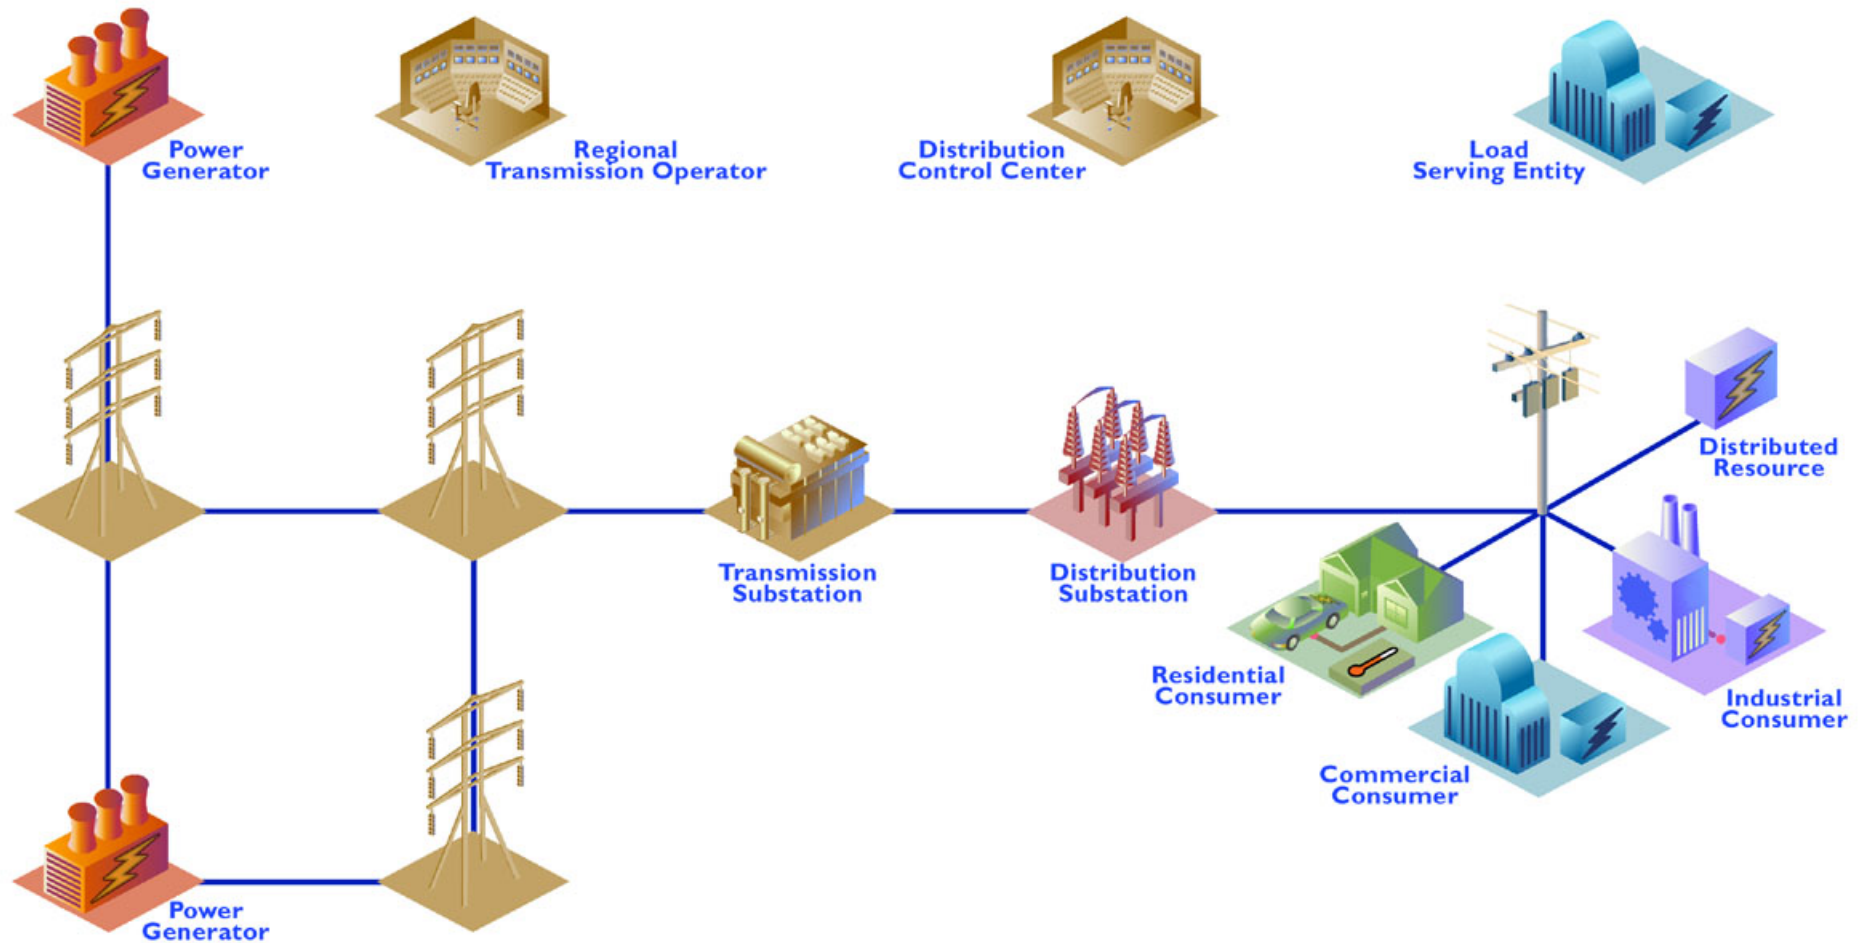

- Automating The Manufacturing Process
- Worker Skill Set Training
- Energy Effectiveness
 - Utilization
 - Ensure the reliability of the critical infrastructure

Manufacturing in America: A Comprehensive Strategy to
Address the Challenges to U.S. Manufacturing

Today's Power Delivery System Needs Modernization

- Investment needed to date is immense - \$400 Billion in book value
- Current System
 - Antiquated Design
 - 1950's Technology
 - 21st Century End – Users
- Needs Modernization
 - Reliability / Security
 - Control
 - Advanced customer services
- LIPA'S System is Representative of the general state of the Industry

Today's Electric Infrastructure

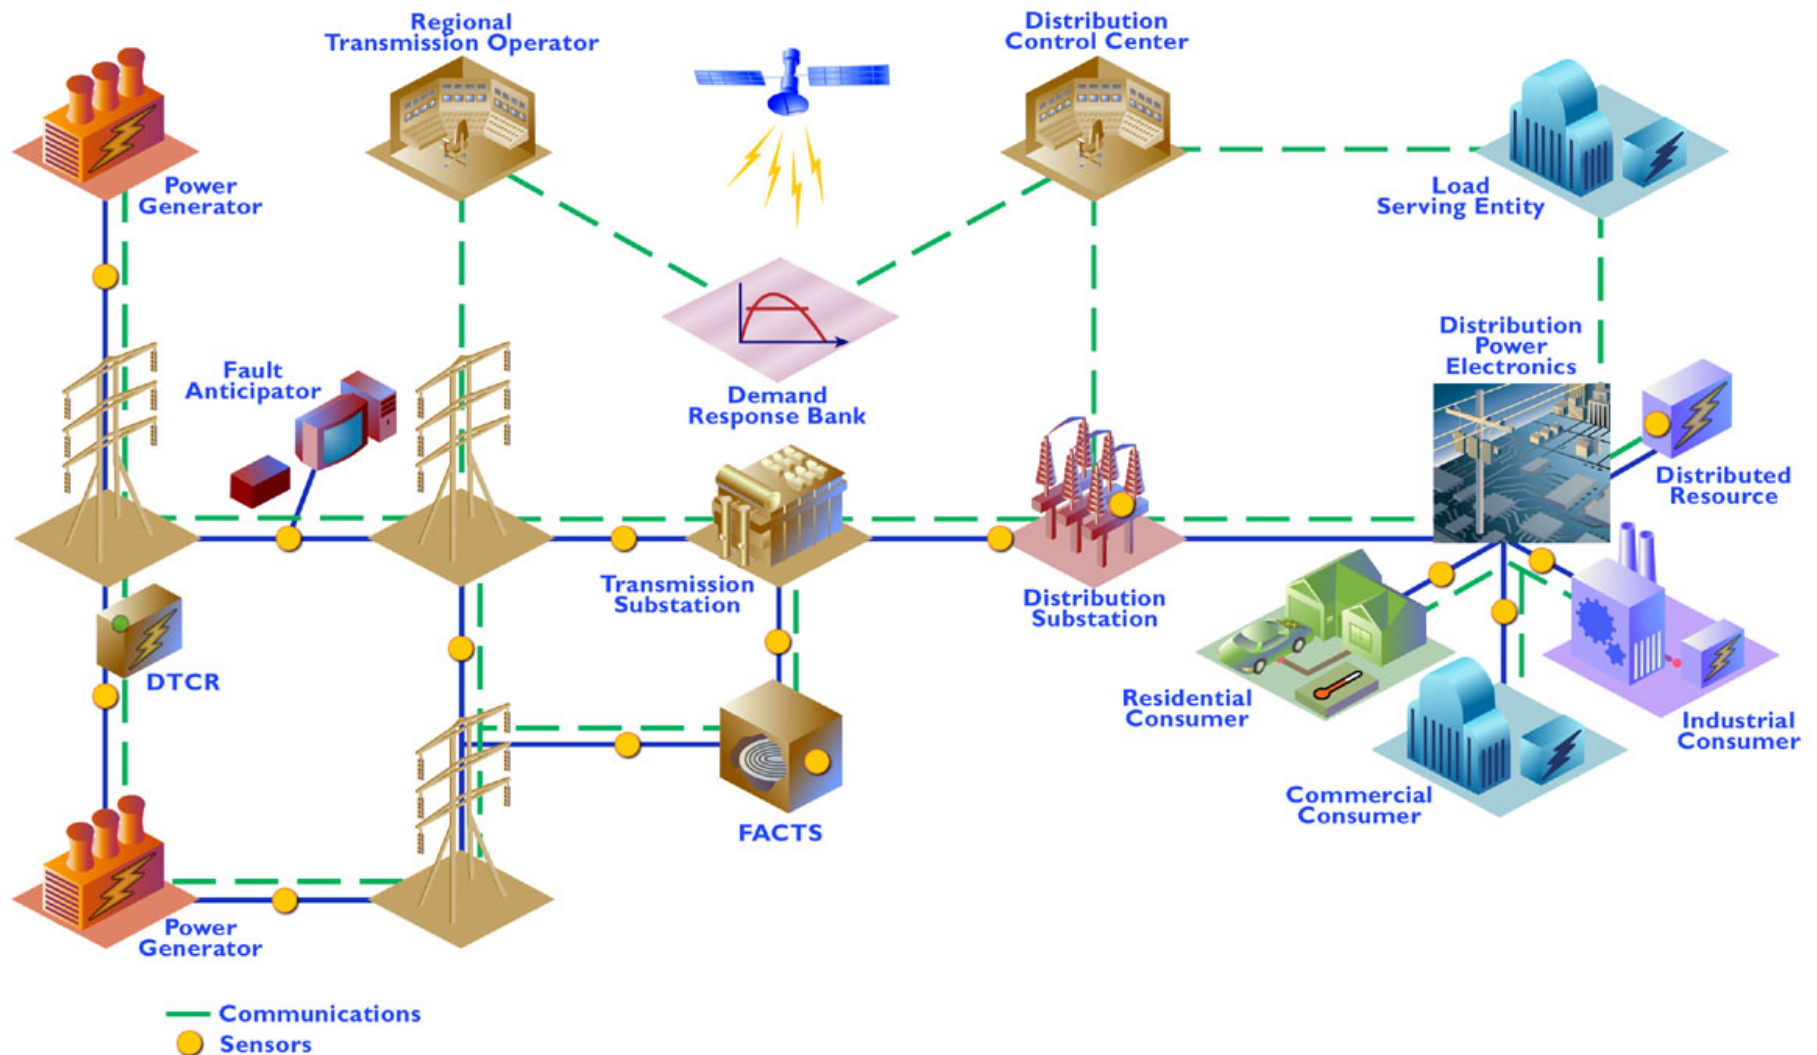

The Power Delivery System of the Future – The “Intelligent Grid”

Makes use of communications, computing, sensing & power electronics technologies to create a system that is:

- *Self-Healing* and *Adaptive*
- *Interactive* with consumers and markets
- *Optimized* to make best use of resources and equipment
- *Predictive* rather than reactive, to prevent emergencies
- *Distributed* across geographical and organizational boundaries
- *Integrated*, merging monitoring, control, protection, maintenance, EMS, DMS, marketing, and IT
- *More Secure* from attack

The Electric Infrastructure for a Self-Healing Grid

Attributes and Benefits: The Intelligent Grid

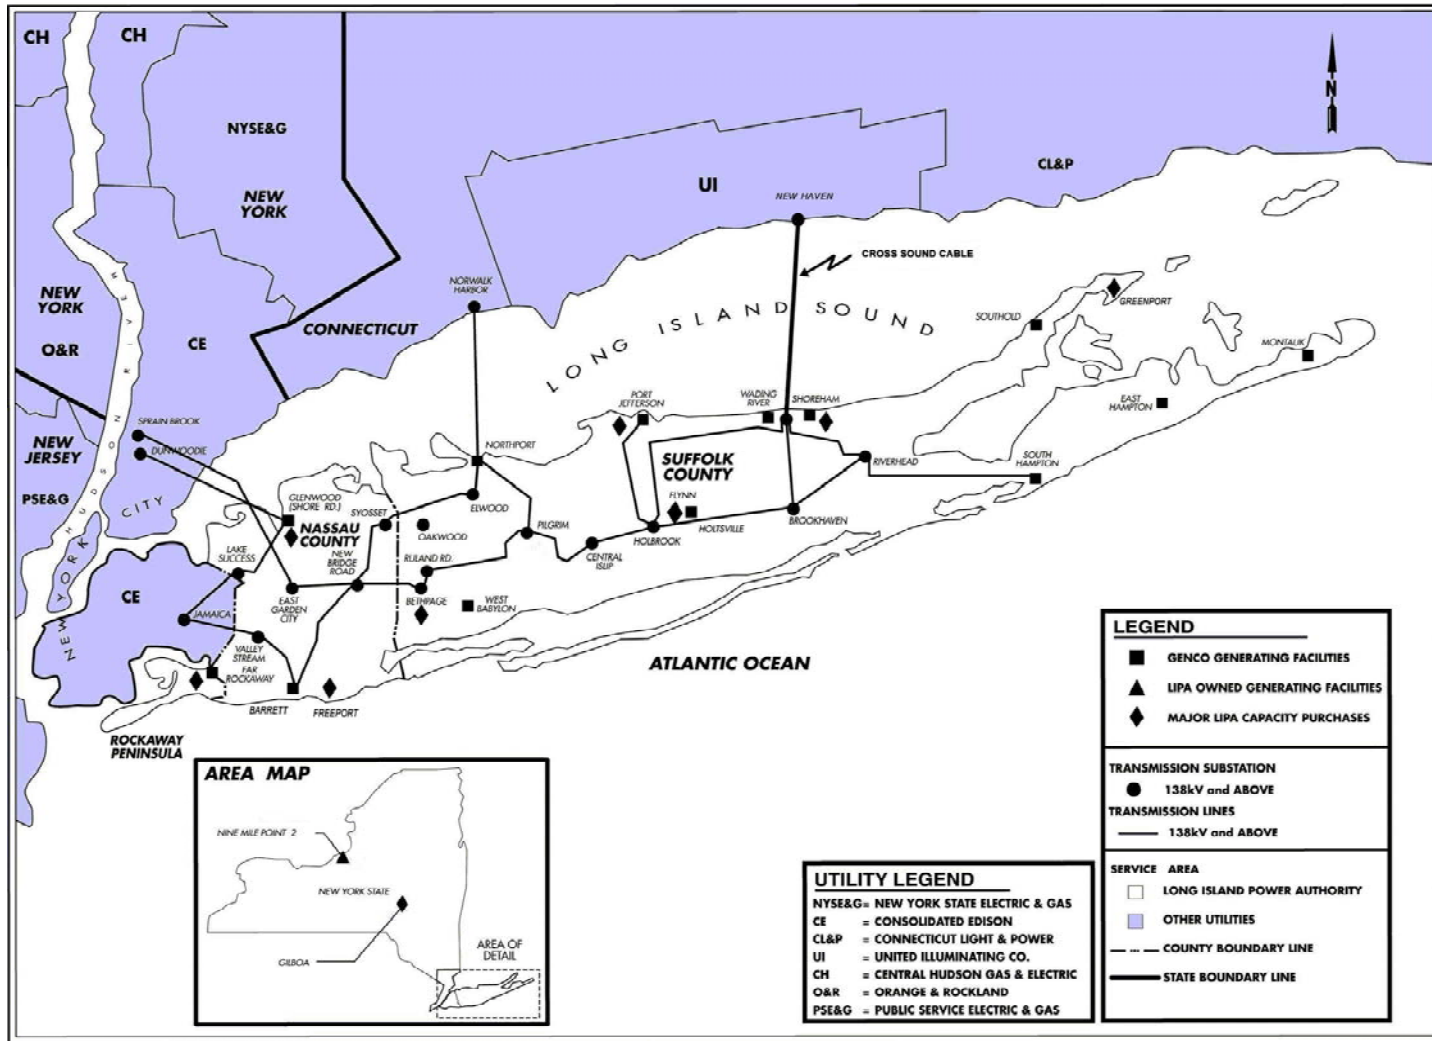

Power Delivery (Improvements/ Benefits) 	Attributes  	Consumer Portal (Improvements/ Benefits)
O&M Cost Capital Cost of Asset T&D Losses	<i>Cost of Energy (Net delivered life-cycle cost of energy service)</i>	End Use Energy Efficiency Capital cost, end user infrastructure O&M, End User Infrastructure Control/Manage Use
Increased Power Flow New Infrastructure Demand Responsive Load	<i>Capacity</i>	Improved power factor. Lower End User Infrastructure cost through economies of scale and system streamlining, expand opportunity for growth
Enhanced Security Self Healing Grid for Quick Recovery	<i>Security</i>	Enhanced Security and ability to continue conducting business and every day functions
Improve Power Quality and enhance equipment operating window	<i>Quality</i>	Improve Power Quality and enhance equipment operating window
Reduce frequency and duration of outages	<i>Reliability</i>	Enhanced Security Self Healing Grid for Quick Recovery
Reduced EMF Reduction in SF6 (sulfur hexafluoride) emissions Reduction in cleanup costs Reduction in power plant emissions	<i>Environment</i>	Improved Esthetic Value Reduced EMF Industrial Ecology
Safer work environment for utility employees	<i>Safety</i>	Safer work environment for end-use electrical facilities
Value added electric related services	<i>Quality of Life</i>	Comfort Convenience
Increase productivity due to efficient operation of the power delivery infrastructure Real GDP	<i>Productivity</i>	Improved consumer productivity Real GDP

LIPA'S Efforts in Grid Modernization

About the Long Island Power Authority

- Established In May of 1998
- Long Island's primary electric service provider
- The third largest public power utility in the nation in terms of customers served
- More than 1.1 million customers – 20,000 GWH in Annual Sales
- System of 535,000 utility poles, 8,866 miles of overhead wire, and almost 5,000 miles of underground cable.
- As an Island limited off- island supply
- System automation limited to the “Average” customer (yet more than 1300 ATO's /ASU's deployed on our system)

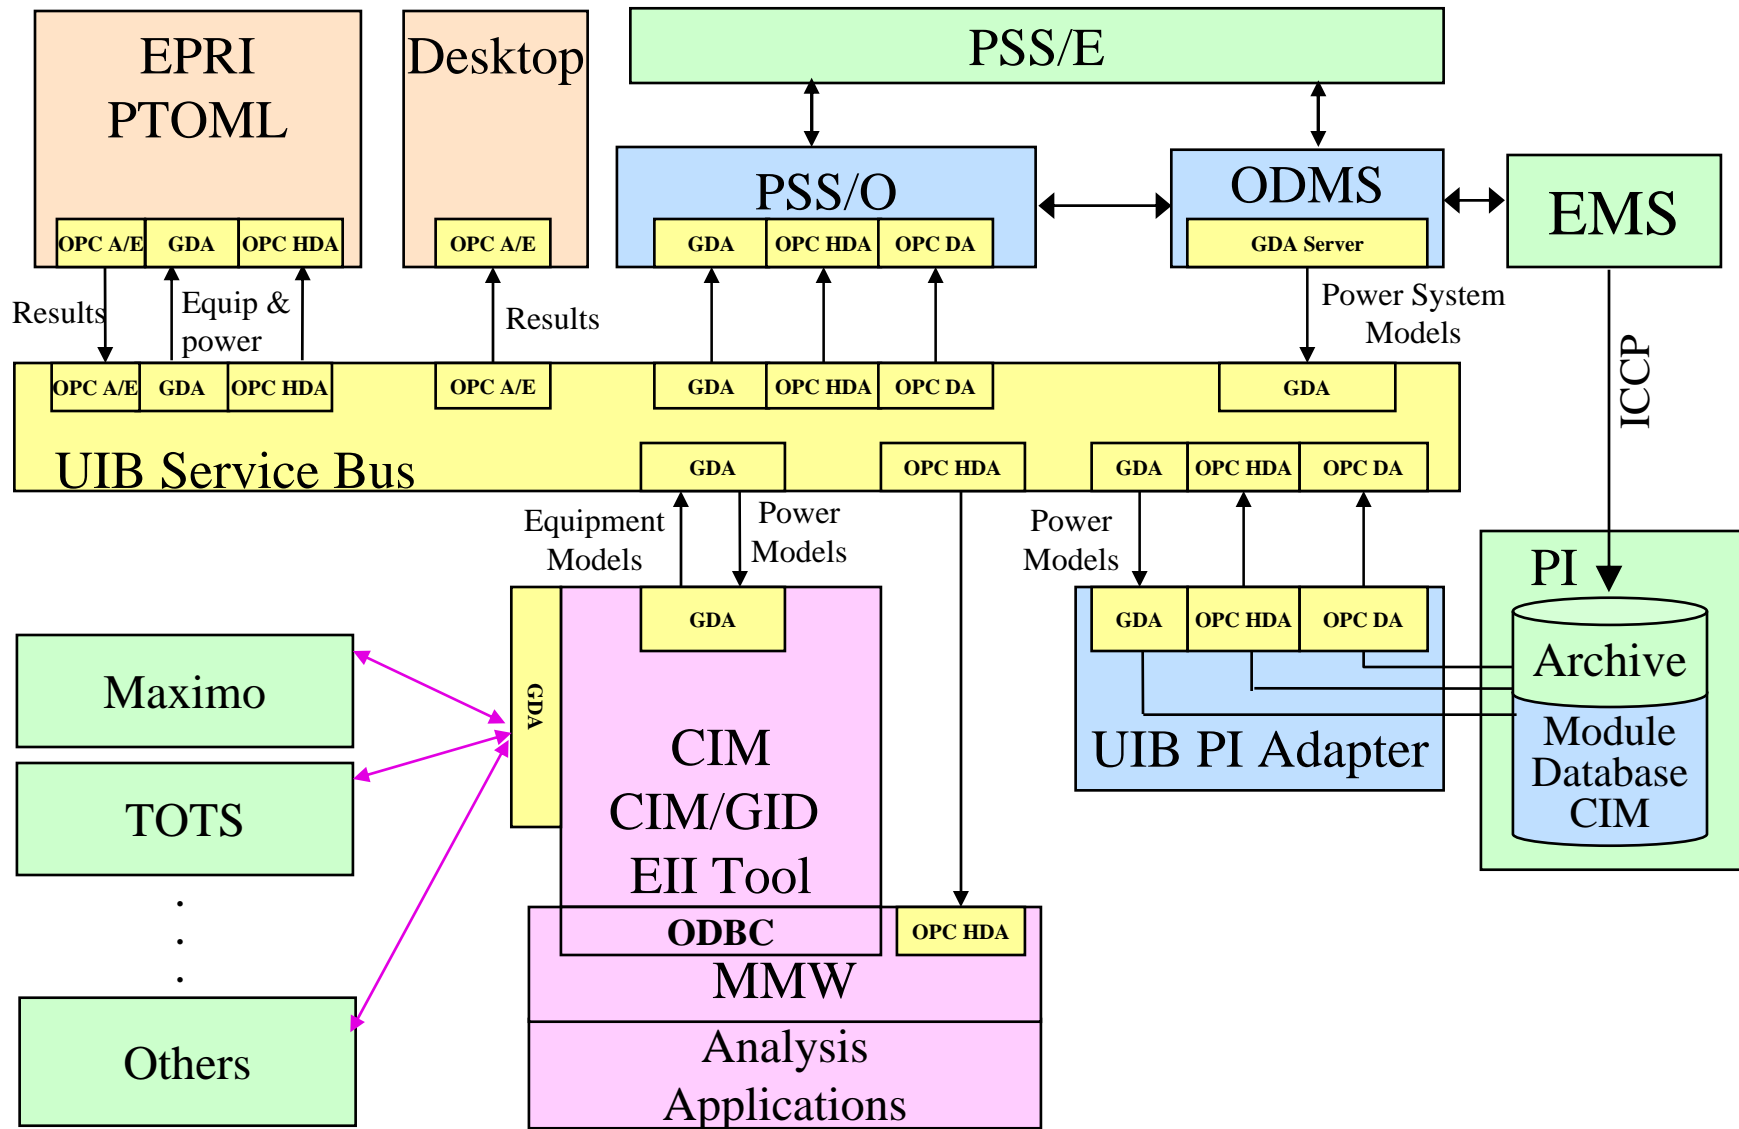

LIPA's Service Area

LIPA's Current Strategy for Grid Modernization

- Collaboration
 - Industry vision for the Modern Grid: IntelliGrid
 - Customer Vision for what a Modern Grid should provide: Advanced Manufacturing Demonstration
- Strategic Opportunities for Modern Grid Application
 - Systems Architecture Design and Construction
 - Design and Eventual Construction of a Communications Medium to Support Deployment of Modern Grid Techniques
- Demonstration and Testing
 - Intelligent Grid concepts through BPL Demonstration
 - Superconducting Transmission Cable

LIPA Systems Architecture Utilizing IntelliGrid

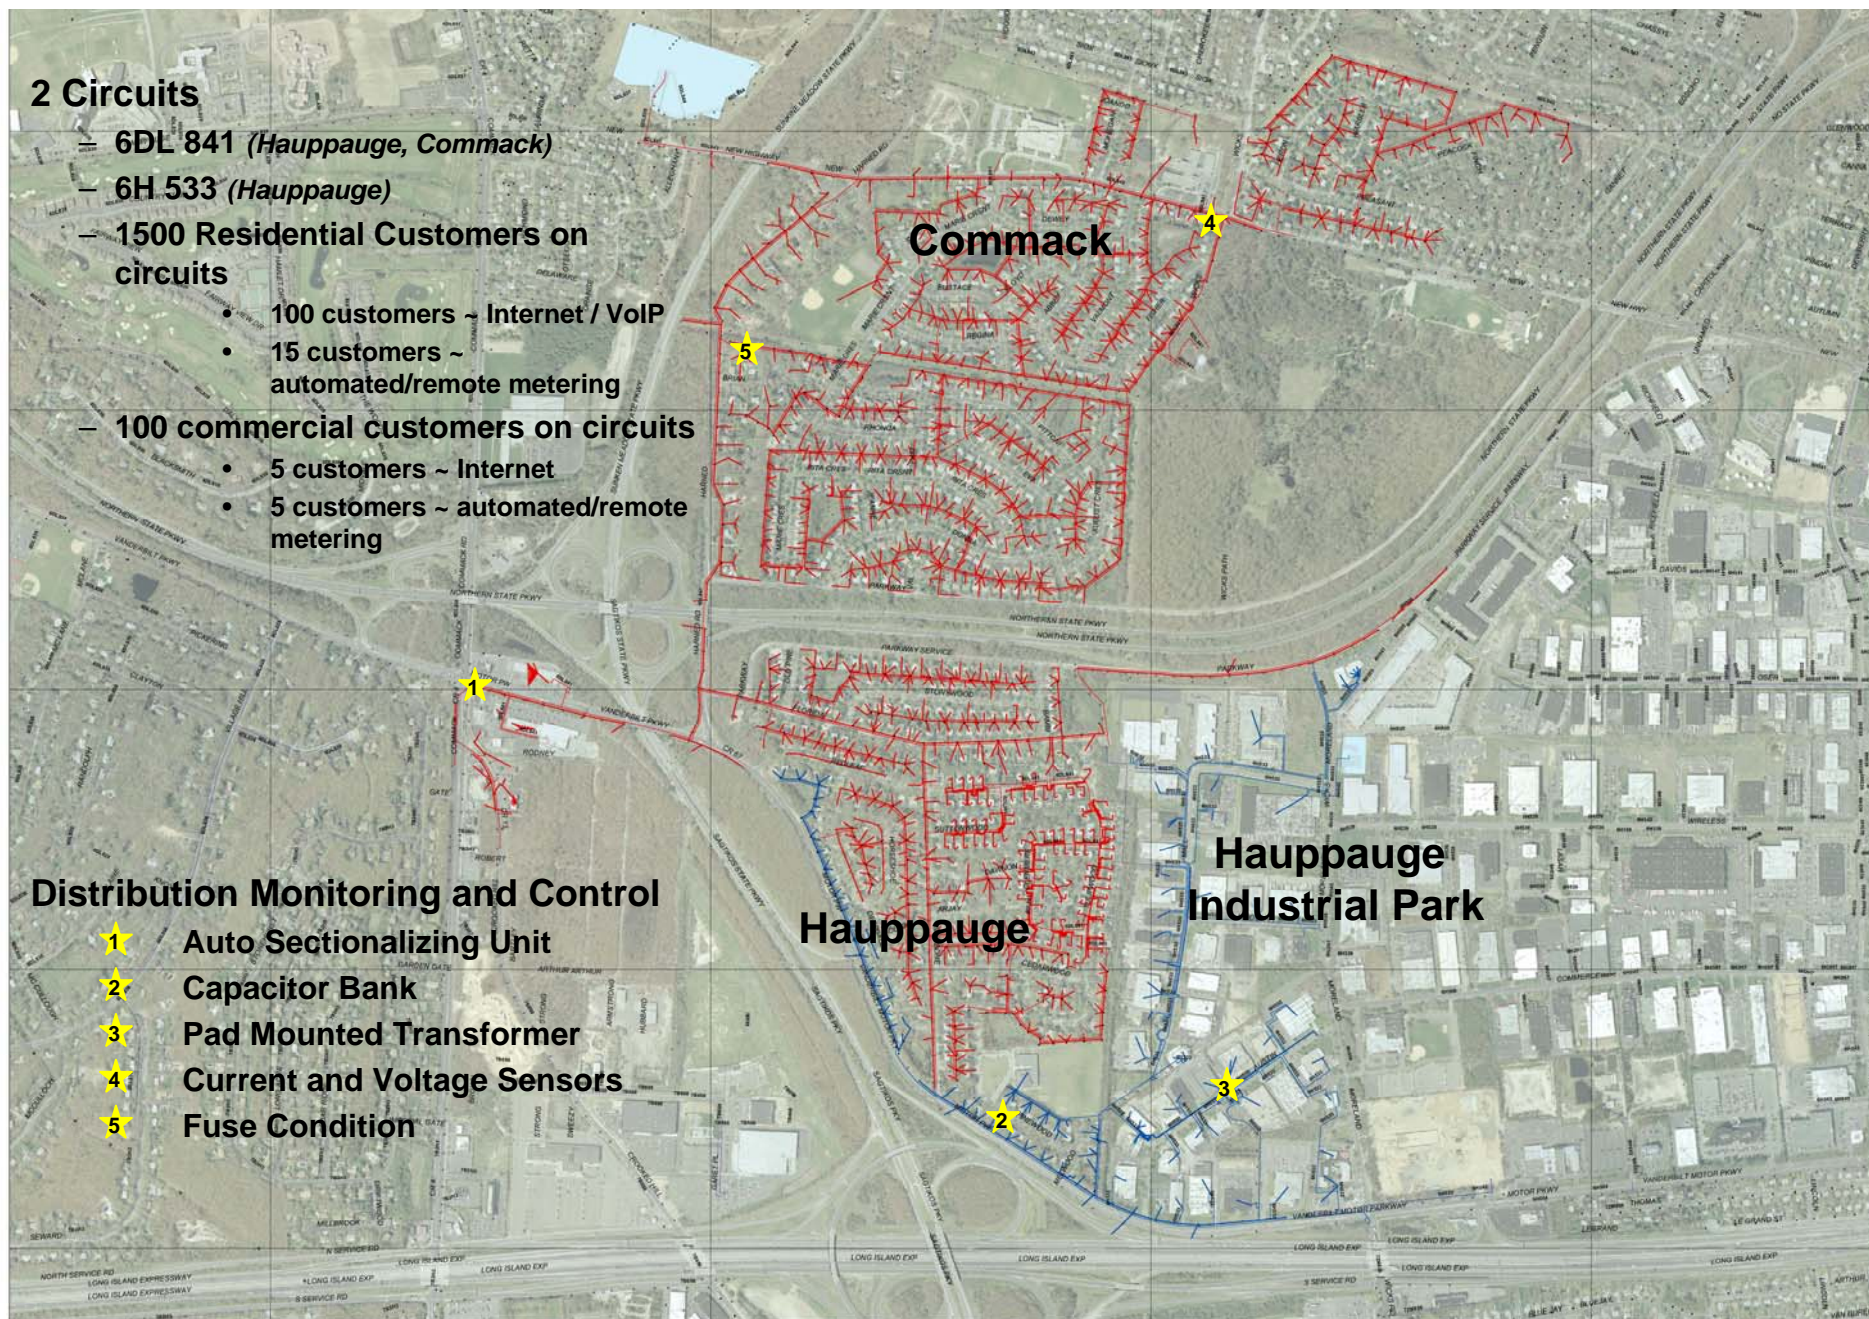

LIPA BPL Demonstration Project

2 Circuits

- 6DL 841 (*Hauppauge, Commack*)
- 6H 533 (*Hauppauge*)
- 1500 Residential Customers on circuits
 - 100 customers ~ Internet / VoIP
 - 15 customers ~ automated/remote metering
- 100 commercial customers on circuits
 - 5 customers ~ Internet
 - 5 customers ~ automated/remote metering

Distribution Monitoring and Control

- 1 Auto Sectionalizing Unit
- 2 Capacitor Bank
- 3 Pad Mounted Transformer
- 4 Current and Voltage Sensors
- 5 Fuse Condition

Holbrook Superconducting Transmission Cable

Electrical / Physical Characteristics

- 600 Meters (~2000 feet)
- 3 separate phases in conduit
- Cold Dielectric Design
- 2 sets of terminations
- 1 refrigeration system
- 6.6 kW; He/LN₂ Cycle
- Design Voltage / Current 138 kV / 2400 A (600 MVA)
- Operating Voltage / Current 138 kV / 920 A (220 MVA)
